For Medication Assisted Treatment

Counseling & MAT: Better Outcomes with Integrated Care

Stacey C. Conroy LICSW, MPH, LADC1
Supervisory Social Worker Mental Health & Substance Abuse
VA Medical Center
Richmond Virginia

Stacey C. Conroy LICSW, MPH, LADC1, Disclosures

- **Stacey C. Conroy LICSW, MPH, LADC1** has no financial relationships to disclose.

The contents of this activity may include discussion of off label or investigative drug uses. The faculty is aware that is their responsibility to disclose this information.

Planning Committee, Disclosures

AAAP aims to provide educational information that is balanced, independent, objective and free of bias and based on evidence. In order to resolve any identified Conflicts of Interest, disclosure information from all planners, faculty and anyone in the position to control content is provided during the planning process to ensure resolution of any identified conflicts. This disclosure information is listed below:

The following developers and planning committee members have reported that they have no commercial relationships relevant to the content of this module to disclose: PCSSMAT lead contributors Maria Sullivan, MD, PhD, Adam Bisaga, MD and Frances Levin, MD; AAAP CME/CPD Committee Members Dean Krahn, MD, Kevin Sevarino, MD, PhD, Tim Fong, MD, Robert Milin, MD, Tom Kosten, MD, Joji Suzuki, MD; AMERSA staff and faculty Colleen LaBelle, BSN, RN-BC, CARN, Doreen Baeder and AAAP Staff Kathryn Cates-Wessel, Miriam Giles and Blair-Victoria Dutra.

All faculty have been advised that any recommendations involving clinical medicine must be based on evidence that is accepted within the profession of medicine as adequate justification for their indications and contraindications in the care of patients. All scientific research referred to, reported, or used in the presentation must conform to the generally accepted standards of experimental design, data collection, and analysis. Speakers must inform the learners if their presentation will include discussion of unlabeled/investigational use of commercial products.

Accreditation Statement

- This activity has been planned and implemented in accordance with the accreditation requirements and policies of the Accreditation Council for Continuing Medical Education (ACCME) through the joint providership of American Academy of Addiction Psychiatry (AAAP) and Association for Medical Education and Research in Substance Abuse (AMERSA). AAAP is accredited by the ACCME to provide continuing medical education for physicians.

Designation Statement

- American Academy of Addiction Psychiatry designates this enduring material for a maximum of 1 (one) *AMA PRA Category 1 Credit™*. Physicians should only claim credit commensurate with the extent of their participation in the activity.
 - Date of Release: October 20, 2014
 - Date of Expiration: July 31, 2016

System Requirements

- In order to complete this online module you will need Adobe Reader. To install for free click the link below:
 - <http://get.adobe.com/reader/>

Target Audience

- The overarching goal of PCSS-MAT is to make available the most effective medication-assisted treatments to serve patients in a variety of settings, including primary care, psychiatric care, and pain management settings.

Educational Objectives

- At the conclusion of this activity participants should be able to:
 - Identify 4 Evidence Based Practices (EBPs) for use to enhance MAT outcomes
 - Cognitive Behavioral Therapy (CBT)
 - Acceptance & Commitment Therapy
 - Motivational Interviewing
 - Twelve-Step Facilitation
 - Identify skills from each of the above EPBs that may be used in a variety of treatment settings
 - Increase understanding of SUD mutual self-help groups

Common Terms – Medication Assisted Treatment, MAT

- What is Medication Assisted Treatment
- MAT is the use of medications, in combination with counseling and behavioral therapies, to provide a whole-patient approach to the treatment of substance use disorders. Research shows that when treating substance-use disorders, a combination of medication and behavioral therapies is most successful. Medication assisted treatment (MAT) is clinically driven with a focus on individualized patient care.

<http://dpt.samhsa.gov/patients/mat.aspx>

Common Terms – Supportive Counseling

- Supportive counseling/psychotherapy is a widely used approach employed by many different health professionals in both mental and physical health settings.
- Supportive counseling/psychotherapy is used to facilitate optimal adjustment, either to situations of ongoing stress, such as chronic mental or physical illness, or in acutely stressful situations as, for example, following bereavement.

<http://www.huntlycentre.com.au/updates/posts/view/17>

Common Terms – Evidence Based Practice, EBP

- What is Evidence-Based Practice?
- Demonstrating effectiveness in empirical research that meets a standard of scientific rigor. National Registry of Evidence based Program and Practices (NREPP) criteria for effectiveness and scientific rigor are embodied in its minimum review requirements, which include the stipulation that an intervention must have demonstrated one or more positive behavioral outcomes ($p \leq .05$) in substance abuse and/or mental health in at least one study using an experimental or quasi-experimental design.

<http://www.nrepp.samhsa.gov/AboutGlossary.aspx?selChar=E>

Common Terms – Mutual Self Help Groups

- Mutual [self-help] groups are non-professional and include members who share the same problem and voluntarily support one another. Mutual aid groups do not provide formal treatment but provide social, emotional and informational support focused on taking responsibility for their alcohol and drug problems and their sustained health, wellness, and recovery.

<http://www.ncadd.org/index.php/get-help/mutual-aid-support-groups/146-mutual-aid>

Standards of Care for the Addiction Medicine Specialist Physician include Psychosocial Needs as Part of the Recovery Process

- Standard III 2: Under Treatment Planning Ends With
- When pharmacotherapies are part of the treatment plan, the addiction specialist physician decides with the patient about the setting for treatment, assuring appropriate dosage and duration for the medication, monitors adherence, and assures psychosocial therapies occur throughout the treatment process. This includes referral to counseling, and/or self-help groups – treatment outcomes are poorer without addressing psychosocial issues

<http://www.asam.org/docs/default-source/publications/standards-of-care-final-design-document.pdf>

Adopted by the ASAM Board of Directors, © Copyright 2014.

Behavioral Changes – Consequences of SUD – Without Co-Occurring Disorders

- **Behavioral manifestations and complications** of addiction, primarily due to impaired control, can include:
- Excessive use and/or engagement in addictive behaviors, at higher frequencies and/or quantities than the person intended, often associated with a persistent desire for and unsuccessful attempts at behavioral control;
- Excessive time lost in substance use or recovering from the effects of substance use and/or engagement in addictive behaviors, with a significant adverse impact on social and occupational functioning (e.g. the development of interpersonal relationship problems or the neglect of responsibilities at home, school or work);
- Continued use and/or engagement in addictive behaviors, despite the presence of persistent or recurrent physical or psychological problems which may have been caused or exacerbated by substance use and/or related addictive behaviors.

Cognitive – Emotional Changes Without Co-Occurring Disorders

- **Cognitive changes** in addiction can include:
 - Altered evaluations of the relative benefits and detriments associated with drugs or rewarding behaviors; and
 - The inaccurate belief that problems experienced in one's life are attributable to other causes rather than being a predictable consequence of addiction.
- **Emotional changes** in addiction can include:
 - Increased anxiety, dysphoria and emotional pain;
 - Increased sensitivity to stressors associated with the recruitment of brain stress systems, such that “things seem more stressful” as a result.

<http://www.asam.org/for-the-public/definition-of-addiction>

Co-Occurring Disorders Often Need to be Treated Currently

Scope of Co-Occurrence

- Approximately 8.9 million adults in the U.S. have co-occurring disorders; that is, they have both a mental and substance use disorder.
- Only 7.4 percent of individuals receive treatment for both conditions with 55.8 percent receiving no treatment at all.

Improved Outcomes

- Reduced substance use
- Improved psychiatric symptoms and functioning
- Decreased hospitalization
- Increased housing stability
- Fewer arrests
- Improved quality of life

<http://media.samhsa.gov/co-occurring/>

MAT Treatment Settings & Challenges for Counseling

Each type of treatment setting has unique challenges to providing psychosocial/counseling services for integrated addiction treatment

- Opioid Treatment Programs – Usually have MH staff on site, may need training in EBPs
- Buprenorphine specific programs – May or may not have MH staff on site; ability to refer needed
- Single-practitioner Buprenorphine prescriber – May provide him-/herself or ability to refer needed
- Primary Care Buprenorphine prescriber – Same as above
- Therapy Practice – Supporting MAT – May need training in EBPs

Locating Counseling

National Resources:

- SAMHSA has a treatment locator for substance abuse and mental health treatment
 - Go to the SAMHSA site a click on treatment locator

Local Resources:

- Develop a resource binder with various local options for counseling and other resources that may be helpful for psychosocial needs
 - Have a social work or psychology intern develop the binder
 - In following years have these interns update the binder
 - Share the binder with colleagues in private practice who do not have social work or psychology interns

Types of Evidence Based Practices

EBPs

- SAMSA has a registry to EBPs for substance abuse and mental health treatment – we will explore 3 that lend themselves to the various treatment settings reviewed in previous slides
 - Motivational Interviewing
 - Cognitive Behavioral Therapy
 - Acceptance and Commitment Therapy
 - Twelve-Step Facilitation
- There are many other EBPs listed in the registry, these lend themselves to brief interventions in various settings

Motivational Interviewing

- Motivational Interviewing (MI) is a goal-directed, client-centered counseling style for eliciting behavioral change by helping clients to explore and resolve ambivalence. The operational assumption in MI is that ambivalent attitudes or lack of resolve is the primary obstacle to behavioral change, so that the examination and resolution of ambivalence becomes its key goal. MI has been applied to a wide range of problem behaviors related to alcohol and substance abuse as well as health promotion, medical treatment adherence, and mental health issues.

<http://www.nrepp.samhsa.gov/ViewIntervention.aspx>

Process of MI

- Establishing rapport with the client and listening reflectively.
- Asking open-ended questions to explore the client's own motivations for change.
- Affirming the client's change-related statements and efforts.
- Eliciting recognition of the gap between current behavior and desired life goals.
- Asking permission before providing information or advice.
- Responding to resistance without direct confrontation. (Resistance is used as a feedback signal to the therapist to adjust the approach.)
- Encouraging the client's self-efficacy for change.
- Developing an action plan to which the client is willing to commit.

Cognitive Behavioral Treatment

- Cognitive Behavioral Therapy (CBT) is the term used for a group of psychological treatments that are based on scientific evidence. These treatments have been proven to be effective in treating many psychological disorders.
- Cognitive and behavioral therapies usually are short-term treatments (i.e., often between 6-20 sessions) that focus on teaching clients specific skills. CBT is different from many other therapy approaches by focusing on the ways that a person's cognitions (i.e., thoughts), emotions, and behaviors are connected and affect one another.
<http://www.abct.org/Help/?m=mFindHelp&fa=WhatIsCBTpublic>
- Cognitive behavioral therapy (CBT) for substance use disorders has demonstrated efficacy as both a monotherapy and as part of combination treatment strategies.

(McHugh, Hearon, & Otto, 2010)

Process of CBT

- The therapist and client work together with a mutual understanding that the therapist has theoretical and technical expertise, but the client is the expert on him- or herself.
- The therapist seeks to help the client discover that he/she is powerful and capable of choosing positive thoughts and behaviors.
- Treatment is often short-term. Clients actively participate in treatment in and out of session. Homework assignments often are included in therapy. The skills that are taught in these therapies require practice.
- Treatment is goal-oriented to resolve present-day problems. Therapy involves working step-by-step to achieve goals.
- The therapist and client develop goals for therapy together, and track progress toward goals throughout the course of treatment.

<http://www.abct.org/Help/?m=mFindHelp&fa=WhatIsCBTpublic>

10 Common Cognitive Distortions

- **All-Or-Nothing Thinking** – You see things in black-and-white categories. If your performance falls short of perfect, you see yourself as a total failure.
- **Overgeneralization** – You see a single negative event as a never-ending pattern of defeat.
- **Mental Filter** – You pick out a single negative defeat and dwell on it exclusively so that your vision of reality becomes darkened, like the drop of ink that colors the entire beaker of water.
- **Disqualifying the positive** – You dismiss positive experiences by insisting they “don’t count” for some reason or other. In this way you can maintain a negative belief that is contradicted by your everyday experiences.

Cognitive Distortions Cont.

- **Jumping to conclusions** – You make a negative interpretation even though there are no definite facts that convincingly support your conclusion.
 - **A. Mind reading.** You arbitrarily conclude that someone is reacting negatively to you, and you don't bother to check this out.
 - **B. The fortune teller error.** You anticipate that things will turn out badly, and you feel convinced that your prediction is an already-established fact.
- **Magnification (Catastrophizing) or Minimization-** You exaggerate the importance of things (such as your goof-up or someone else's achievement), or you inappropriately shrink things until they appear tiny (your own desirable qualities or the other fellow's imperfections). This is also called the “binocular trick.”

Cognitive Distortions Cont.

- **Emotional Reasoning** – You assume that your negative emotions necessarily reflect the way things really are: “I feel it, therefore it must be true.”
- **Should Statements** – You try to motivate yourself with “shoulds” and “shouldn’ts,” as if you had to be whipped and punished before you could be expected to do anything. “Musts” and “oughts” are also offenders. The emotional consequence is guilt. When you direct “should” statements toward others, you feel anger, frustration, and resentment.

Cognitive Distortions Cont.

- **Labeling and Mislabeled** – This is an extreme form of overgeneralization. Instead of describing your error, you attach a negative label to yourself: “I’m a loser.” When someone else’s behavior rubs you the wrong way, you attach a negative label to him: “He’s a louse.” Mislabeled involves describing an event with language that is highly colored and emotionally loaded.
- **Personalization** – You see yourself as the cause of some negative external event for which, in fact, you were not primarily responsible.

Acceptance and Commitment Therapy – ACT

- Acceptance and Commitment Therapy (ACT) is a contextually focused form of cognitive behavioral psychotherapy that uses mindfulness and behavioral activation to increase clients' psychological flexibility--their ability to engage in values-based, positive behaviors while experiencing difficult thoughts, emotions, or sensations. ACT has been shown to increase effective action; reduce dysfunctional thoughts, feelings, and behaviors; and alleviate psychological distress for individuals with a broad range of mental health issues (including DSM-5 diagnoses, coping with chronic illness, and workplace stress). ACT establishes psychological flexibility by focusing on six core processes:

<http://www.nrepp.samhsa.gov/ViewIntervention.aspx>

Six Core Processes of ACT

- Acceptance of private experiences (i.e., willingness to experience odd or uncomfortable thoughts, feelings, or physical sensations in the service of response flexibility)
- Cognitive diffusion or emotional separation/distancing (i.e., observing one's own uncomfortable thoughts without automatically taking them literally or attaching any particular value to them)
- Being present (i.e., being able to direct attention flexibly and voluntarily to present external and internal events rather than automatically focusing on the past or future)
- A perspective-taking sense of self (i.e., being in touch with a sense of ongoing awareness)
- Identification of values that are personally important
- Commitment to action for achieving the personal values identified

Instructions. In the outer boxes, place your rating (0-10) of how much importance (i) this domain has in your life. In the inner boxes, place your rating of how much reward, reinforcement, meaning you have gotten from each domain in the past 2 weeks.

Joel Guama PhD 2007
www.whitepinepsych.com

10 Step to Trying on a Value

- **Choose a Value.** Choose valued directions that you are willing to try on for at least a week. This should be a value that *you* can enact and a value that you care about. This is not a time to try to change others or manipulate them into changing.
- **Notice Reactions.** Notice anything that comes up about whether or not this is a good value, or whether or not you really care about this value. Just notice all thoughts for what they are. Remember that your mind's job is to create thoughts. Let your mind do that and you stay on the exercise.
- **Make a List.** Take a moment to list a few behaviors that one might say are related to the chosen value.
- **Choose a Behavior.** From this list, choose one behavior or set of behaviors you can commit to between now and next session or the next few sessions.
- **Notice Judgments.** Notice anything that comes up about whether or not that is a good behavior, whether or not you will enjoy it, or whether you can actually do that to which you are committing yourself.

Trying on Values Cont.

- **Make a Plan.** Write down how you will go about enacting this value in the very near future (today, tomorrow, this coming weekend, at the next meeting with your supervisor). Consider anything you will need to plan or get in order (e.g., call another person, clean the house, make an appointment, etc.). Choose when to do that – the sooner the better.
- **Just Behave.** Even if this value involves other people, *do not tell them what you are doing*. See what you can notice if you just enact this value without telling them it is an ‘experiment’.
- **Keep a Daily Diary of Your Reactions.** Things to look for are others’ reactions to you, any thoughts feelings or body sensations that occur before, during and after the behavior, and how you feel doing it for the second (or fifth, or tenth, or hundredth) time. Watch for evaluations that indicate whether this activity, value, or valued direction was ‘good’ or ‘bad’ or judgments about others, or yourself in relation to living this value. Gently thank your mind for those thoughts, and see if you can choose not to buy into the judgments it makes about the activity.
- **Commit.** Every day. Notice anything that shows up as you do so.
- **Reflect.** Please bring your Daily Reactions Diary back to session on:

Twelve-Step Facilitation (TSF) Therapy

- Twelve-Step Facilitation Therapy (TSF) is a brief, structured, and manual-driven approach to facilitating early recovery from alcohol abuse, alcoholism, and other drug abuse and addiction problems. TSF is implemented with individual clients or groups over 12-15 sessions. The intervention is based on the behavioral, spiritual, and cognitive principles of 12-step fellowships such as Alcoholics Anonymous (AA) and Narcotics Anonymous (NA). These principles include acknowledging that willpower alone cannot achieve sustained sobriety, that reaching out to others must replace self-centeredness, and that long-term recovery consists of a process of spiritual renewal.

<http://www.nrepp.samhsa.gov/ViewIntervention.aspx>

Process of TSF

- Therapy focuses on two general goals:
 - (1) acceptance of the need for abstinence from alcohol and other drug use and
 - (2) surrender, or the willingness to participate actively in 12-step fellowships as a means of sustaining sobriety.
- The TSF counselor assesses the client's alcohol or drug use, advocates abstinence, explains the basic 12-step concepts, and actively supports and facilitates initial involvement and ongoing participation in AA.
- The counselor also discusses specific readings from the AA/NA literature with the client, aids the client in using AA/NA resources in crisis times, and presents more advanced concepts such as moral inventories.

Mutual Self Help Groups 12-Step Research

- Assess self-help group (AA, NA) participation
- Interview of alcohol day substance abuse tx outpatients from an HMO
- Avg 22 meetings in 1 year before entry onto substance abuse tx, 81 in yr after, then 55-63 in yrs 2-3
- 76% went to AA

Mutual Self Help Groups

12-Step Groups

Twelve Steps of Alcoholics Anonymous www.aa.org Copyright A.A. World Services, Inc.

1. We admitted we were powerless over alcohol—that our lives had become unmanageable.
2. Came to believe that a power greater than ourselves could restore us to sanity.
3. Made a decision to turn our will and our lives over to the care of God *as we understood Him*.
4. Made a searching and fearless moral inventory of ourselves.
5. Admitted to God, to ourselves, and to another human being the exact nature of our wrongs.
6. Were entirely ready to have God remove all these defects of character.
7. Humbly asked Him to remove our shortcomings.
8. Made a list of all persons we had harmed, and became willing to make amends to them all.
9. Made direct amends to such people wherever possible, except when to do so would injure them or others.
10. Continued to take personal inventory, and when we were wrong, promptly admitted it.
11. Sought through prayer and meditation to improve our conscious contact with God *as we understood Him*, praying only for knowledge of His will for us and the power to carry that out.
12. Having had a spiritual awakening as the result of these steps, we tried to carry this message to alcoholics, and to practice these principles in all our affairs.

PCSS-MAT Mentoring Program

- PCSS-MAT Mentor Program is designed to offer general information to clinicians about evidence-based clinical practices in prescribing medications for opioid addiction.
- PCSS-MAT Mentors comprise a national network of trained providers with expertise in **medication-assisted treatment, addictions and clinical education.**
- Our 3-tiered mentoring approach allows every mentor/mentee relationship to be unique and catered to the specific needs of both parties.
- The mentoring program is available, at no cost to providers.

For more information on requesting or becoming a mentor visit:

PROVIDERS' CLINICAL SUPPORT SYSTEM

For Medication Assisted Treatment

PCSSMAT is a collaborative effort led by American Academy of Addiction Psychiatry (AAAP) in partnership with: American Osteopathic Academy of Addiction Medicine (AOAAM), American Psychiatric Association (APA), American Society of Addiction Medicine (ASAM) and Association for Medical Education and Research in Substance Abuse (AMERSA).

For More Information: www.pcssmat.org

Twitter: [@PCSSSProjects](https://twitter.com/PCSSSProjects)

Funding for this initiative was made possible (in part) by Providers' Clinical Support System for Medication Assisted Treatment (5U79TI024697) from SAMHSA. The views expressed in written conference materials or publications and by speakers and moderators do not necessarily reflect the official policies of the Department of Health and Human Services; nor does mention of trade names, commercial practices, or organizations imply endorsement by the U.S. Government.

Please Click the Link Below to Access the Post Test for this Online Module

[Click here to take the Module Post Test](#)

Upon completion of the Post Test:

- If you pass the Post Test with a grade of 80% or higher, you will be instructed to click a link which will bring you to the Online Module Evaluation Survey. Upon completion of the Online Module Evaluation Survey, you will receive a CME Credit Certificate or Certificate of Completion via email.
- If you received a grade of 79% or lower on the Post Test, you will be instructed to review the Online Module once more and retake the Post Test. You will then be instructed to click a link which will bring you to the Online Module Evaluation Survey. Upon completion of the Online Module Evaluation Survey, you will receive a CME Credit Certificate or Certificate of Completion via email.
- After successfully passing, you will receive an email detailing correct answers, explanations and references for each question of the Post Test.
